

EasyOpen

RFID PROXIMITY DOOR CONTROL

The Taylor EasyOpen uses RFID proximity technology to authorise access to doors, windows, cabinets, enclosures, safes, etc.

Simply holding an authorised ProxTag close to the reader is all that is necessary to gain access.

There are no external components to jam, or be vandalised, or attract unwanted attention. The combined reader and controller is housed in an attractive architectural brushed aluminium surface case and brushed stainless faceplate with dead-front lens, and is mounted on the secure side of the door. Only the antenna is mounted outside the door.

- 999 user capacity
- Master ProxTag allows tags to be added and removed easily
- The identification time is a fraction of a second, so access is virtually instantaneous
- ProxTags can be programmed into multiple locks, providing just one 'key' for all secure access needs
- Unlike conventional keys, lost ProxTags can simply be erased from the reader, eliminating the need to replace the lock
- Taylor EasyOpen can operate through glass, giving the option of mounting the antenna on the inside of a window
- Combined reader / controller is mounted on the secure side of the door
- Attractive antenna with brushed stainless effect finish
- Antenna can be surface mounted, flush mounted or recessed and plastered over to give a completely vandal-proof installation
- Compatible with most types of release – magnetic, electric, etc
- Input connection for egress button
- 'Touch to exit' unit available: this is a touch and proximity sensitive plate with brushed stainless finish to match the EasyOpen unit
